

I strongly endorse the rule making that would restrict wideband modes on 160 Meters to that area above 1843 KHz. The movement of SSB stations into areas that should be reserved for narrow band modes like CW, should be prohibited, and in addition, there should be a set of monitoring criteria to enable effective and timely enforcement of this new rule. For those of us that operate mostly low power or QRP, this is even more important as we have no ability to get through the types of interference that more powerful SSB and other wideband modes produce.
